Sequence 37, Application US/09494190
Patent No. 6610512
GENERAL INFORMATION:
APPLICANT: BARBAS, Carlos F.
APPLICANT: BARBAS, CARLOS F.
TITLE OF INVENTION: ZINC FINGER BINDING DOMAINS FOR GNN
FILE REFERENCE: TSRI 645.2
CURRENT APPLICATION NUMBER: US/09/494,190
CURRENT FILING DATE: 2000-01-28
PRIOR APPLICATION NUMBER: EP/99/0742
PRIOR APPLICATION NUMBER: US 09/173,941
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ; OTHER INFORMATION: Description of Artificial Sequence: nucleotide ; OTHER INFORMATION: codon binding sequence US-09-173-941-37

```
The invention relates to an isolated nucleic acid comprising any one of CC the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: CC (1) a vector comprising a promoter operably linked to the nucleic acid (2) encoding a polypeptide whose expression is inhibited by the antisense culleic acid; (2) a host cell containing the vector; (3) an isolated continense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for the gene product or that has an activity against a biological pathway in which a proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which the test compound that inhibits gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; sectivity; (11) a culture comprising strains in which the gene compound that inhibits proliferation of an organism acts; (12) determining the extent compound; (12) determining the extent continuent is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits proliferation of continuent or screening for homologous nucleic acids are useful for cellular proliferation to isolate candidate molecules for rational continuent or confidence molecules for rational continuent c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       21-MAR-2001; 2001US-00815242.

                 drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ABU26526;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ABU26526 standard; protein; 643
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       21-MAR-2002; 2002WO-US009107.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        03-OCT-2002

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cc residues in the alpha helix. Each zinc finger can recognise a subsite of callows the recognition of extended contiguous asymmetric DNA sequences. CC for example, a synthetic polydactyl protein containing six zinc finger comains containing the recognise and symmetric DNA sequences. CC for example, a synthetic polydactyl protein containing six zinc finger comains can recognise an 18 by sequence, and such proteins are comains therefore be used in the development of artificial contentially highly gene-specific. The novel nucleotide-binding zinc finger proteins may therefore be used in the development of artificial conservation of which is involved in malignant transcriptional switches conversable are therefore useful in the treatment of cancers, and may also be used to activate genes involved in fighting diseases, and to treat viral infections by inhibiting the synthesis of viral gene products. They can be used in producing functional gene knockout or activation in can discriminate between sequences which have a single base difference. This is manifested in a >100-fold decrease in affinity for the variant converting sequence. Gene activation and repression can be achieved by targetting convertines. Sequences AAB02876-B02889 represent zinc finger alpha helix convertions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                          The invention comprises a library of multimeric DNA binding polypeptides (e.g. zinc finger DNA binding polypeptides). The zinc finger binding polypeptides of the invention are useful for sterically occluding the binding site of a natural transcription factor and enhancing or silencing target gene expression. The present amino acid sequence represents a zinc finger DNA binding peptide of the invention.
                                                                                                                                                                      New zinc finger library of multimeric DNA binding polypeptides, useful for sterically occluding the binding site of a natural transcription factor, and enhancing or silencing target gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 7 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      nucleotide binding region having a sequence of Gly-Cys-Arg-Glu-Leu-Val-Arg. The invention is used in the regulation of the expression of the nucleotide sequence that contains sequence 5' (GNV)n-3'. The present sequence represents the amino acid sequence of a zinc finger binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an expression of nucleotide sequence that contains sequence 5'-(GNN)n-3', in which n is 1-6, is regulated by exposing nucleotide sequence to compositation comprising isolated and purified zinc finger-nucleotide binding polypeptide that contains a

Barbas CF;

WPI; 2000-339648/29.

Novel isolated and purified zinc finger nucleotide-binding proteins with specificity for GNN triplet sequences, useful in gene therapy and for regulating gene function.

Disclosure; Fig 1; 48pp; English.

The invention relates to zinc finger nucleotide-binding proteins which comprise 2-12, preferably 2-6, operatively linked motifs selected from sequences AAB02860-B02875. Sequences AAB02860-B02875 represent the alpha helical regions of zinc finger domains which specifically bind to target nucleotide triplets of the sequence 5'-GNN-3'. Such regions may be linked by the peptide linker TGEKR (AAB02970). The Cys2-His2 zinc finger motif is the most frequently utilised nucleic acid binding motif in eukaryotes, and constitutes a beta-beta-alpha fold. Nucleic acid recognition is
